Fundamentals of Data Communication Networks - Oliver C. Ibe 2017-11-01

What every electrical engineering student and technical professional needs to know about data exchange across networks. While most electrical engineering students learn how the individual components that make up data communication technologies work, they rarely learn how the parts work together in complete data communication networks. In part, this is due to the fact that until now there have been no texts on

data communication networking written for undergraduate electrical engineering students. Based on the author's years of classroom experience, Fundamentals of Data Communication Networks fills that gap in the pedagogical literature, providing readers with a much-needed overview of all relevant aspects of data communication networking, addressed from the perspective of the various technologies involved. The demand for information exchange in networks continues to grow at a staggering rate, and that demand will continue to mount exponentially as the number of interconnected IoT-enabled devices grows to an expected twenty-six billion by the year 2020. Never has it been more urgent for engineering students to understand the fundamental science and technology behind data communication, and this book, the first of its kind, gives them that understanding. To achieve this goal, the book: Combines signal theory, data protocols, and wireless networking concepts into one text Explores the full range of issues that affect common processes such as media downloads and online games Addresses services for the network layer, the transport layer, and the application layer Investigates multiple access schemes and local area networks with coverage of services for the physical layer and the data link layer Describes mobile communication networks and critical issues in network security Includes problem sets in each chapter to test and fine-tune readers' understanding Fundamentals of Data Communication Networks is a must-read for advanced undergraduates and graduate students in electrical and computer engineering. It is also a valuable working resource for researchers, electrical engineers, and technical professionals.

Data and Computer Network Communication - Shashi Banzal 2007

Data Communications and Networking - Behrouz A. Forouzan 2012-02-17
Data Communications and Networking is designed to help students understand the basics of data communications and networking, and the protocols used in the Internet in particular by using the protocol layering of the Internet and TCP/IP protocol suite. Technologies related to data communication and networking may be the fastest growing in today's culture. The appearance of some new social networking applications is a testimony to this claim. In this Internet-oriented society, specialists need to be trained to run and manage the Internet, part of the Internet, or an organization's network that is connected to the Internet. As both the number and types of students are increasing, it is essential to have a textbook that provides coverage of the latest advances, while presenting the material in a way that is accessible to students with little or no background in the field. Using a bottom-up approach, Data Communications and Networking presents this highly technical subject matter without relying on complex formulas by using a strong pedagogical approach supported by more than 830 figures. Now in its

Fifth Edition, this textbook brings the beginning student right to the forefront of the latest advances in the field, while presenting the fundamentals in a clear, straightforward manner. Students will find better coverage, improved figures and better explanations on cutting-edge material. The "bottom-up" approach allows instructors to cover the material in one course, rather than having separate courses on data communications and networking.

Fundamentals of Computer Networks Matthew N. O. Sadiku

This textbook presents computer networks to electrical and computer engineering students in a manner that is clearer, more interesting, and easier to understand than other texts. All principles are presented in a lucid, logical, step-by-step manner. As much as possible, the authors avoid wordiness and giving too much detail that could hide concepts and impede overall understanding of the material. Ten review questions in the form of multiple-choice objective items are provided at the end of each chapter with answers. The review questions are intended to cover the little "tricks" which the examples and end-of-chapter problems may not cover. They serve as a self-test device and help students determine how well they have mastered the chapter. Provides a comprehensive introduction to key concepts of computer networks, easily digestible for beginners; Uses illustrations, figures and visual comparisons to simplify and clarify the various concepts and applications; Familiarizes students with international standards for computer networks.

COMPUTER NETWORKS The way of interconnecting and communicating people with other people Dr Kranthi Kumar Singamaneni, Mrs Vijaya Saraswathi Redrowthu & Mrs Vasavi Ravuri 2020-08-07

1.1 INTRODUCTION: Ø Computer Networks: A collection of autonomous computers interconnected by a single technology to facilitate data communication. • Two computers are said to be interconnected if they are able to exchange information. The connection need not be via a copper wire; fiber optics, microwaves, infrared, and communication satellites can also be of used. • The computers are autonomous, which are not forcibly started, stopped or controlled by other one. • A system with one control unit and more than one slave is not a computer network. • Computer network consists of end systems or nodes which are capable of transmitting information and which communicate through a transit system interconnected them. The transit system also called as interconnection subsystem or sub network. • The nodes in the computer network comprise the computer, terminals, software and peripherals forming an autonomous system capable of performing information processing. • End system has an interface or interaction through which it is physically connected with subnet. • The interaction point has an address by which end system is identified. • Each end system hosts one or more application entities by which the communication takes place between end systems. • The subnet performs all transmission and switching activities. • Transmission media connect end system and

subnet and carry information.
